

GLASPRO BIRD SAFE - FRITTED GLASS

BIRD-FRIENDLY GLASS SOLUTIONS

Silk-screened ceramic frit glass with patterns can reduce bird collisions with railings. Why? Because the glass railings are always visible, even with strong reflections. GlasPro Bird Safe Fritted Glass is a long-lasting solution that blends bird-friendly function with aesthetics.

The Bird Safe Fritted Glass includes options with white ceramic dots covering 20 percent of the glass or 1/8" lines on the outermost (1st) surface of the glass. The line and dot patterns comply with the bird-friendly 2 x 4 rule.

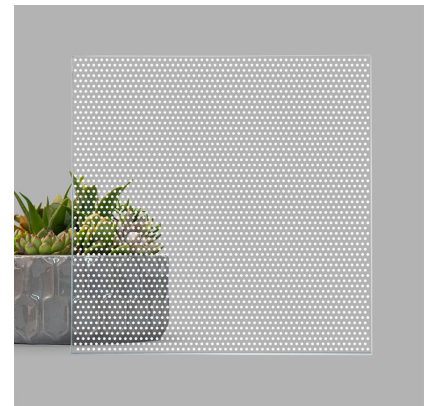

The 2x4 rule describes the distance between elements making up a pattern applied to windows for the purpose of preventing bird strikes. To be effective, the pattern must uniformly cover the entire window and consist of elements of any shape (lines, dots, other geometric figures, etc.) separated by no more than 5 cm (2 inches) if oriented in horizontal rows, or by 10 cm (4 inches) if oriented in vertical columns. These patterns reduce bird-glass railing collisions when applied to the outer surface (Surface #1) of reflective panes. Greater spacing between pattern elements increases the risk of a strike and casualties. GlasPro Bird Safe Fritted glass has a five-year warranty.

Bird Safe Frit | Horizontal Lines

Bird Safe Frit | Vertical Lines

Bird Safe Frit | 20% White Dots
